

A game idea should be playable today

THE PROBLEM

Trying a game idea takes days of setup before anyone can play it. Cloud generators send the idea away and often return code that does not run.

THE USER

Designers, students and hobbyists who want to feel an idea in their hands before they commit to it.

Type one prompt.

Play a 2D game seconds later.

Made on this machine by a local model.
Change it in plain words. Take it away as one HTML file.

From prompt to playable

THEN

Change it in plain words ("make the jumps higher", "more rain"). Every change is validated and must keep every level beatable. Export one offline HTML file; save to the library in the browser.

Seven genres, one text box

Platformer

Runner

Top-down

Arena

Puzzle

Builder

Lane defense

EVERY GAME GETS

- Procedural pixel sprites, tiles, backgrounds
- Generated sound and music
- Several levels, each finished by the bot

OUTSIDE THE GENRES

Classic games (tetris, pong, snake, breakout and more) use hand-written templates. Anything else maps to the closest genre, and the studio says so.

validator errors and repair fixes

qwen3.5:4b on Ollama, loopback only, shared GPU. Prompts: fox platformer, dungeon with keys and doors, bee tower defense, candy sliding puzzle, "a game like Red Ball 5", stickman fight. Model time 10.3 to 12.7 s per design; side-view genres add about 3.8 to 4.6 s while the bot plays every level. Source: docs/RESULTS.md.

Private and safe by construction

LOCAL MODEL

Ollama on loopback. No cloud model, no cloud fallback. The server refuses any non-loopback model address.

NO MODEL CODE

The model writes a design or patch operations, checked by schema and validator. Model-written game code is turned off.

OFFLINE EXPORT

One HTML file with runtime, spec and art inlined; its content security policy blocks all network access.

The director token is handed only to pages opened on this machine.

Limits, said plainly, and what is next

LIMITS

- Seven genres plus classic templates; other ideas become the closest genre
- No new game types at run time while model code is off
- One machine, one designer; library lives in this browser
- Benchmark excludes asset painting and the worker hop

NEXT

- More genres and templates
- A declarative way to describe new mechanics, so new game types need no executable model output
- Sharing libraries between machines

One prompt, a playable game, on your machine.
